Suicide Prevention: Suicide Interventions and Response for Youth Experiencing Serious Emotional Disturbance

JP Legerski, PhD
Associate Professor
Department of Psychology
University of North Dakota
Severe Emotional Disturbances

- IDEA defines emotional disturbance as follows:
  "...a condition exhibiting one or more of the following characteristics over a long period of time and to a marked degree that adversely affects a child’s educational performance:
  (A) An inability to learn that cannot be explained by intellectual, sensory, or health factors.
  (B) An inability to build or maintain satisfactory interpersonal relationships with peers and teachers.
  (C) Inappropriate types of behavior or feelings under normal circumstances.
  (D) A general pervasive mood of unhappiness or depression.
  (E) A tendency to develop physical symptoms or fears associated with personal or school problems."
Developmental Psychopathology and Suicide

2nd leading cause of death among individuals in the US between the ages of 10 and 34

According to a recent article published in the Journal of Abnormal Psychology, between 2009 and 2017

- rates of depression among kids ages 14 to 17 increased by more than 60%,
- The increases were nearly as steep among those ages 12 to 13 (47%) and 18 to 21 (46%), and rates roughly doubled among those ages 20 to 21.
- In 2017—more than one in eight Americans ages 12 to 25 experienced a major depressive episode, the study found.

Gender differences

- Female children and teens 2-3 times more likely to engage in suicidal ideation or make attempts than their male counterparts.
- Male children and teens however are twice more likely to die from suicide than girls.
Suicide

• Ideation
  • Often once per week (among those with suicidal ideation)
  • Last longer and leads to self-injuring less often than NSSI

• Suicidal Plan
  • Serious considerations
  • Taking preparatory actions
  • More closely associated with suicidal intent that ideation

• Suicidal Gestures
  • Taking actions to make others believe they want to kill themselves when there is no intention

• Suicidal attempt
  • Self-injury with at least some intent to die.
  • Among first timers, most are planned and 40% unplanned.
  • Common method: over-the-counter meds.
Risk factors associate with suicide

Major risk factors associate with suicide.

• Social withdrawn, changes in sleep habits, and lack of interest may be symptoms of a depressive disorder.
• History of suicide attempts.
• Openly suicidal statements or comments such as, "I wish I was dead," or "I won't be a problem for you much longer."
• Depression is commonly associated with suicide and suicidal ideation.

Additional risk factors:

• exposure to violence
• impulsivity
• aggressive or disruptive behavior
• family history of suicide attempts
• access to firearms (leading means of suicide completion)
• feelings of hopelessness or helplessness
• Interpersonal difficulties, bullying, and/or rejection
Co-Morbidity

Protective Factors

- Effective clinical care for mental, physical, and substance abuse disorders
- Easy access to a variety of clinical interventions and support for help seeking
- Family and community support (connectedness)
- Support from ongoing medical and mental health care relationships
- Skills in problem solving, conflict resolution, and nonviolent ways of handling disputes
- Cultural and religious beliefs that discourage suicide and support instincts for self-preservation
Intervention Approaches for Depression-related suicide
Individual and Group Interventions for Depression

Evidence-Based Treatment Interventions

• Cognitive Behavioral Therapy (CBT)

• Interpersonal Psychotherapy (IPT) for Adolescents
CBT for Depression

- Cognitive Behavioral Therapy (CBT)

IPT for Depression

- Interpersonal Psychotherapy with Adolescents

IPT Treatment Overview

• Initial Stage
• Intermediate Stages
• Final Stages
## Intermediate Stage & Focus of IPT

<table>
<thead>
<tr>
<th>Foci</th>
<th>Goals of Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grief</td>
<td>Facilitation of the grieving process, the client's acceptance of difficult emotions, &amp; their replacement of lost relationships.</td>
</tr>
<tr>
<td>Role Disputes</td>
<td>Understanding the nature of the dispute, the current communication difficulties, and working to modify the client's communication strategies while remaining in accord with their core values.</td>
</tr>
<tr>
<td>Role transitions</td>
<td>Facilitation of the client's giving up of the old role, expressing emotions about this loss, &amp; acquiring skills and support in the new role they must take on.</td>
</tr>
<tr>
<td>Interpersonal deficits</td>
<td>Analysis of their communication patterns, participate in role playing exercises with the therapist, and work to reduce their overall isolation, if applicable.</td>
</tr>
</tbody>
</table>
Psychopharmacological Interventions for Depression

- tricyclic antidepressants (TCAs)
- selective serotonin reuptake inhibitors (SSRIs)

A note about black box warnings
CASE Study: Billy*

* Billy is a fictional client and reflects a composite of child clients I’ve worked with over the years
Diversity/Resiliency Formulation

In outline form:

- **Intrapersonal**: average intelligence, likes active sports, lack of complete indifference—demonstrates jealousy of siblings; responds to one-on-one tutoring and attention; likes music, especially percussion
- **Interpersonal**: loving, intact family; positive teacher and school setting; parents can afford treatment
- **Community**: upper-middle-class community has many extracurricular activities; few negative community role models, such as gangs
- **Spiritual**: family attends local Presbyterian church
- **Cultural/ethnic**: White family with Scotch-Irish origins
Eco Map

Name: Billy
Date: _________

Billy
age 9

School Peers
Mother, Elizabeth
Father, John
Neighbors
Brother, Josh
Pet dog, Spunky
Church
School Teacher
School Social Worker
Sister, Christy
As you consider Billy’s current circumstances, how would you respond to the following questions?

- What factors may place Billy at risk for depression?
- How might you alter Billy’s treatment plan to address these depressive symptoms?
- Should you discontinue the parent skills training program to address Billy’s conduct-related problems?
Figure 1. The three circles of evidence-based clinical practice.

A MODULAR TRANSDIAGNOSTIC TREATMENT APPROACH

MATCH-ADTC (Chorpita, & Weisz, 2009)
What is MATCH-ADTC?

Modular Approach to Therapy for Children with Anxiety, Depression, Trauma, or Conduct problems

• Individualized, evidence-based therapy for children
MATCH-ADTC
Summary & Anecdotal Impressions

<table>
